### **APPENDIX A – Rockwall Streets Segment-level PCI Data**

### **APPENDIX B – Rockwall Alleys Segment-level PCI Data**

## Introduction

The City of Rockwall, Texas has contracted with Data Transfer Solutions, LLC (DTS) to perform a Pavement Services Management Project for the city's complete maintained roadways. One of the main objectives of this project was to provide the City with detailed inspection and distress information in order to calculate a Pavement Condition Index (PCI) for each segment of maintained road.

In order to achieve this objective, pavement data collection and analysis was performed for approximately 284 centerline miles of roadway in the City network. As per DTS' contract with the City of Rockwall, the road network was evaluated as two separate centerlines: primary street roads and secondary alley roads. This equated to approximately 222 centerline miles of primary streets and 62 centerline miles of secondary alleys.

The total centerline amount represents the segments that were to be evaluated during the Pavement Collection Process. Upon completion of the analysis, the data was then uploaded into DTS' VUEWorks Asset Management Software. In turn, the analyzed pavement data and asset management software calculated the PCI for each road segment.

This pavement condition survey and PCI values will become the basis for management, maintenance, project, and budget decisions for the City. Utilizing the PCI values as the basis for pavement-related decisions will allow the City to build a quantifiable and repeatable process for planning annual pavement maintenance or preservation project funding.

In addition to the standard pavement data collection process, roadway assets pre-determined by the City were extracted from Right-of-Way (ROW) imagery collected in conjunction with the pavement data.

## Purpose

The primary purpose of this document is to describe the tools, processes, and procedures used to collect and analyze the pavement data; as well as provide a summary of the road results obtained from calculating each segment's PCI within the VUEWorks Asset Management Software. As a secondary purpose, a brief summary table was compiled to display all assets extracted along City-maintained roadways. This was included as a separate document.

## 1 Project Scope

The overall project scope of work contains 3 tasks outlined below:

- Verify City Street Network
- Mobile Image Data Collection
- Pavement Condition Index

This report will cover aspects related to the collection, analysis, and reporting of pavement distress data and extracted asset data within the City's Network.

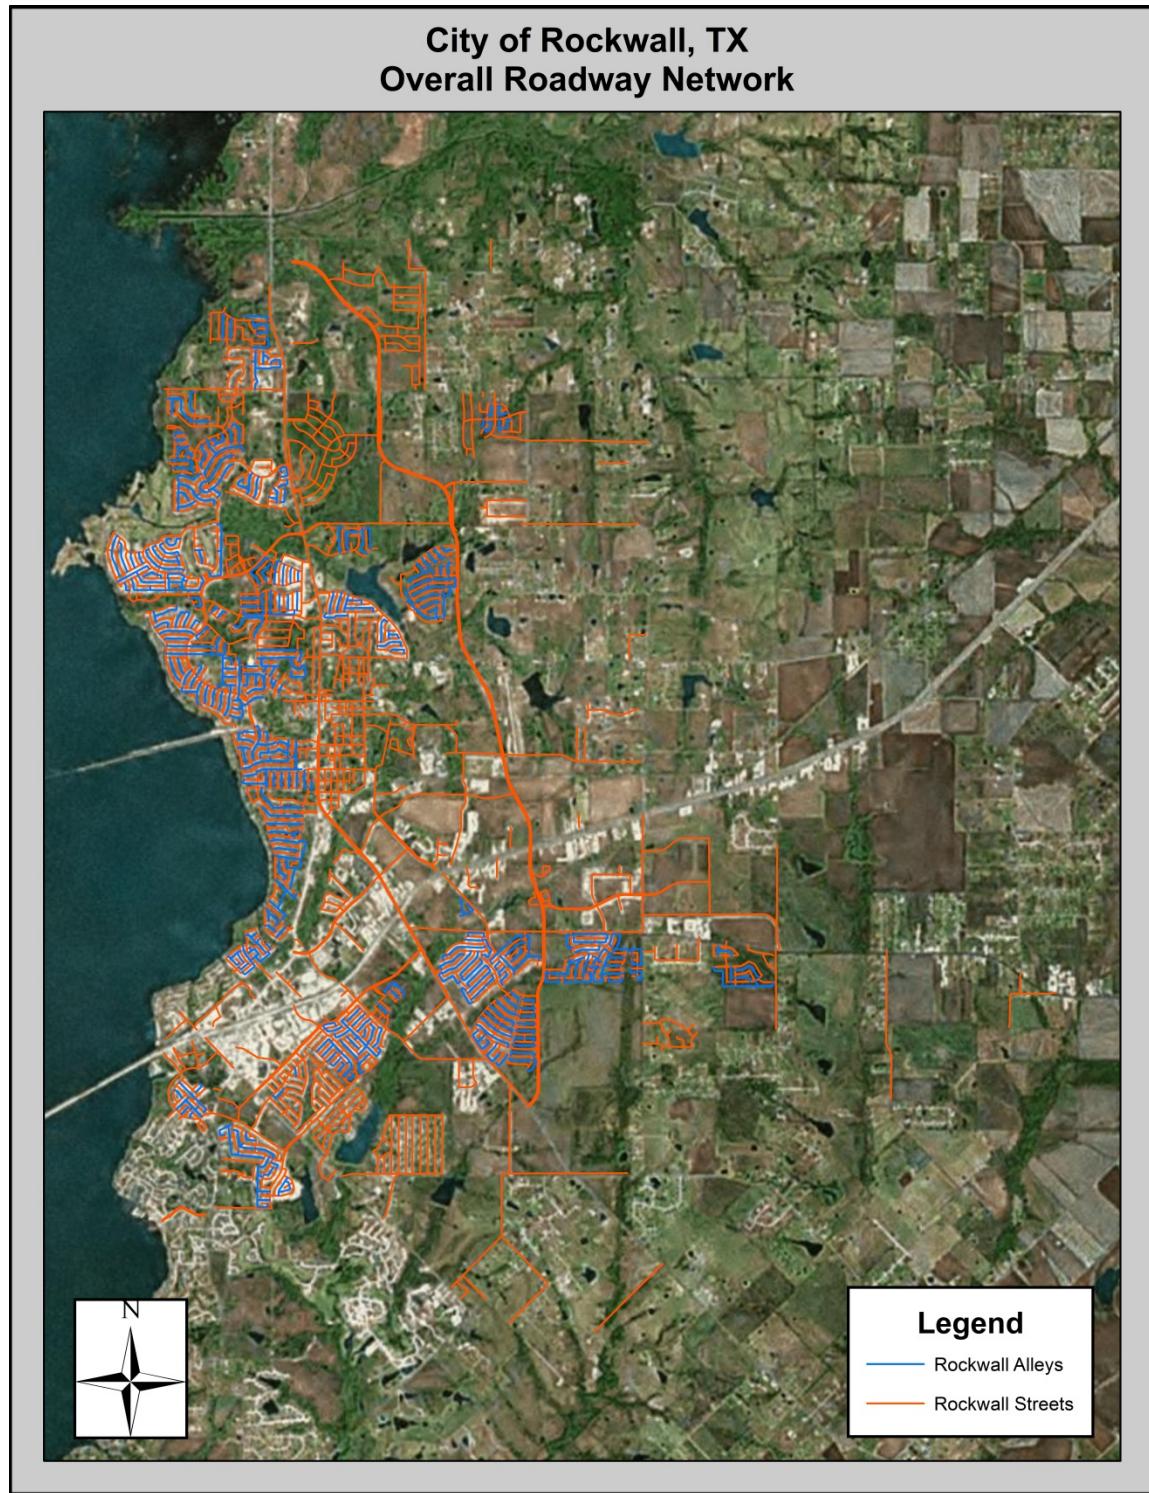

Figure 1 – City of Rockwall Complete Maintained Road Network

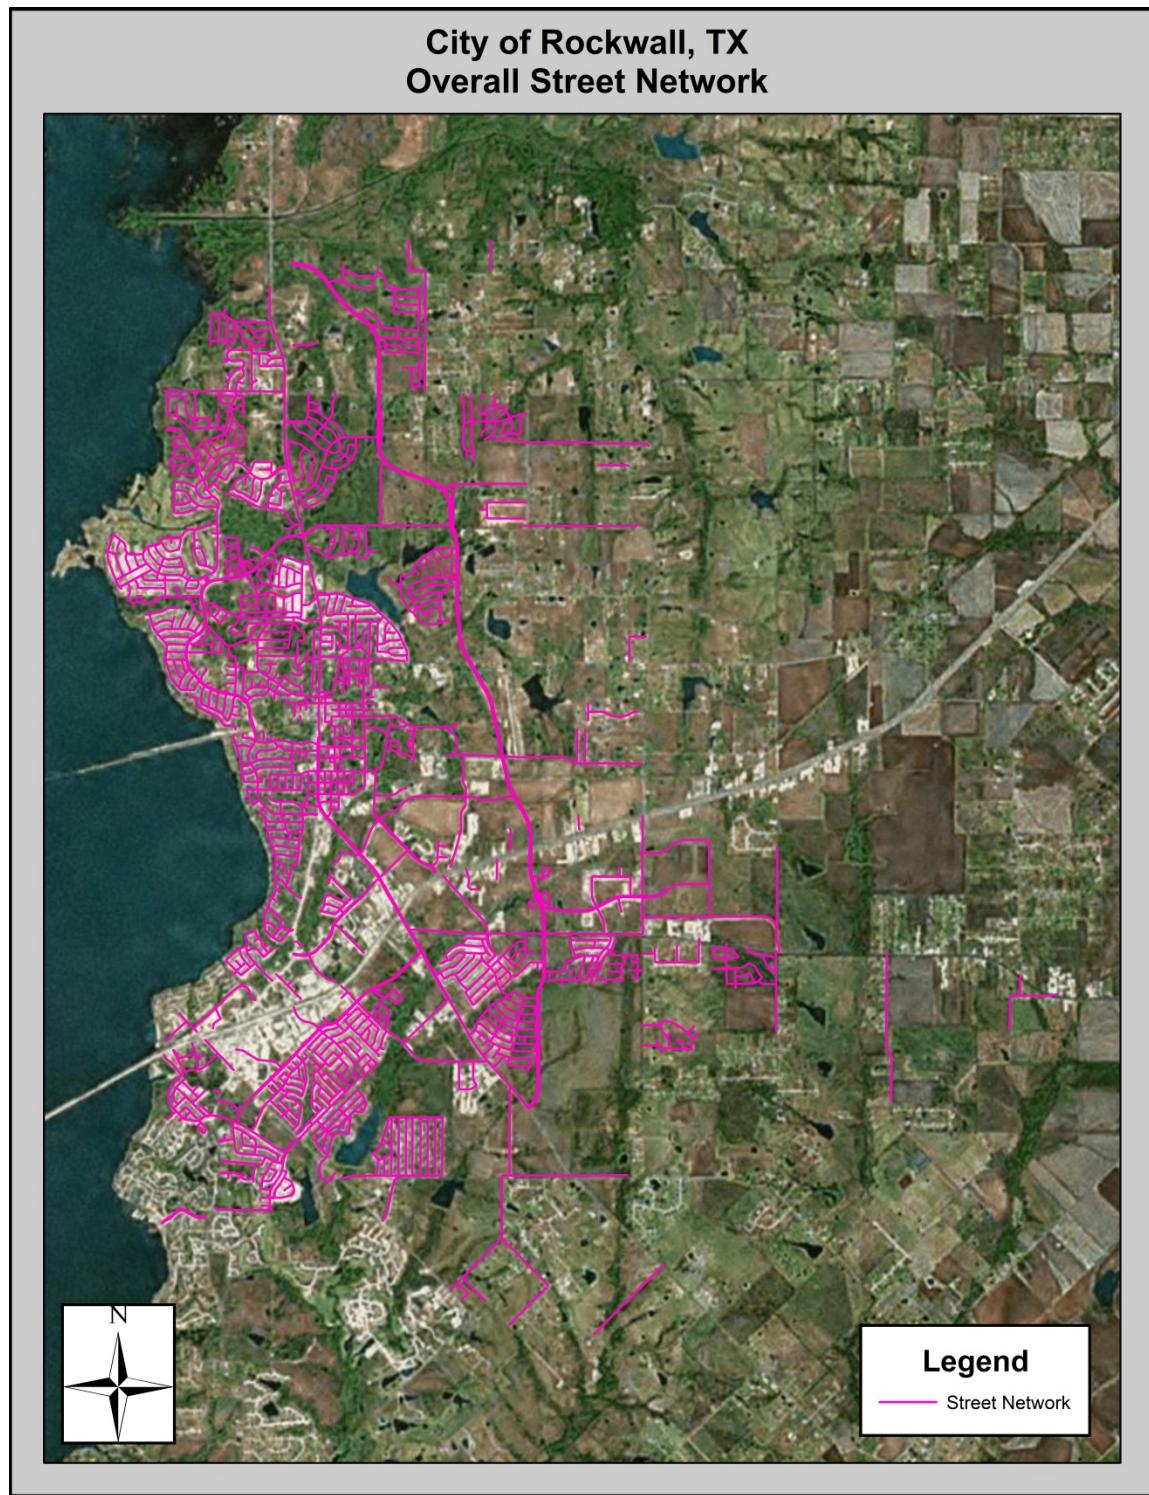

Figure 2 – City of Rockwall Maintained Primary Street Network

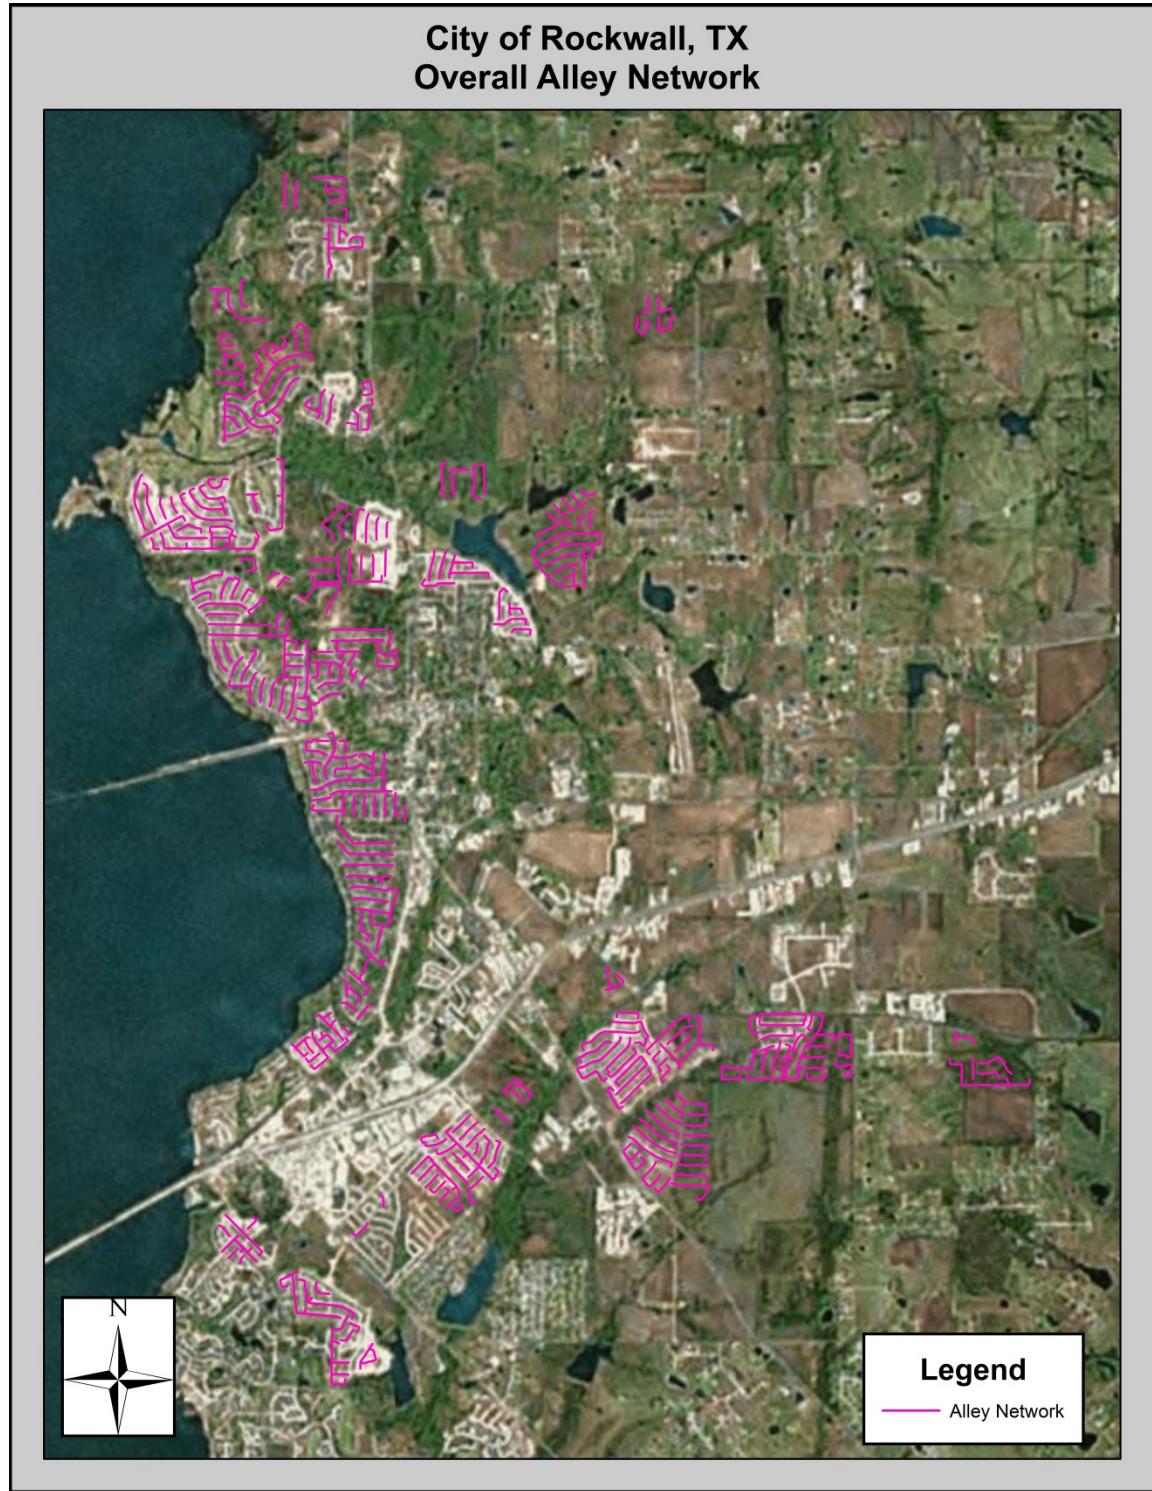

Figure 3 – City of Rockwall Maintained Secondary Alley Network

## 2 Pavement Data Collection

### 2.1 Automated Data Collection and Equipment

In order to determine the general distress characteristics of each roadway segment, DTS utilized our Mobile Asset Collection (MAC) vehicles to collect street-level, right-of-way imagery and downward pavement imagery. The automated distress data collection was performed in general accordance with ASTM D6433-09 (Standard Practice for Roads and Parking Lots Pavement Condition Index Surveys) and ASTM Standard E1656 (Standard Guide for Classification of Automated Pavement Condition Survey Equipment), utilizing a Class 1 device as defined by the specifications.

DTS MAC vehicles combine multiple engineered technologies to collect real-time pavement data, and ROW data and images at posted speed limits. This effectively eliminates the need to place pavement inspection technicians in the field in close proximity to vehicle traffic. Some MAC vehicle components include:

#### **Navigation System**

- **Inertial Measurement Unit (IMU)**: generates a true representation of vehicle motion in all three axes; producing continuous, accurate position and orientation information
- **POS Computer System (PCS)**: enables raw GPS data from as few as one satellite to be processed directly into the system, to compute accurate positional information in areas of intermittent, or no GPS reception
- **GPS Receivers**: Embedded GPS receivers provide heading aiding to supplement the inertial data
- **GPS Antennas**: Two GPS antennas generate raw observables data
- **Sub-meter accuracy**: The system is rated to get 0.3 m accuracy in the X,Y position and 0.5 m in the Z position

#### **Distance Measuring Indicator (DMI)**

- Allows for collection of high resolution imagery at posted speeds. Distance Measurement Indicator computes wheel rotation information to aid vehicle positioning.

#### **Cameras**

- High-definition cameras with precision lenses allow for accurate asset extraction and video-log recording
- Frame rate: 15 images per second, with 1936x1456 color resolution

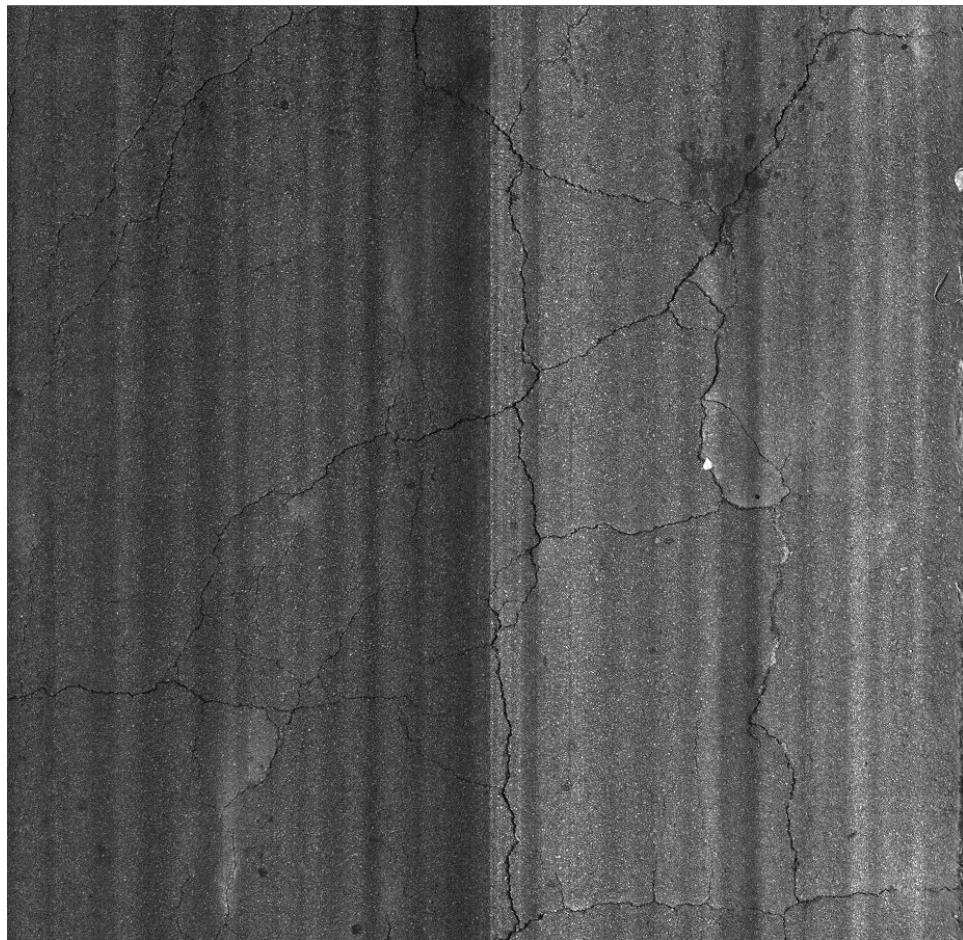

#### **Pavement Imaging System**

- Two line-scan cameras and lasers configured to image 4m transverse road sections with 1 mm resolution (4000 pixel) at speeds that can reach 100 km/h
- Allows fully illuminated pavement image collection even in heavy shadow/canopy areas

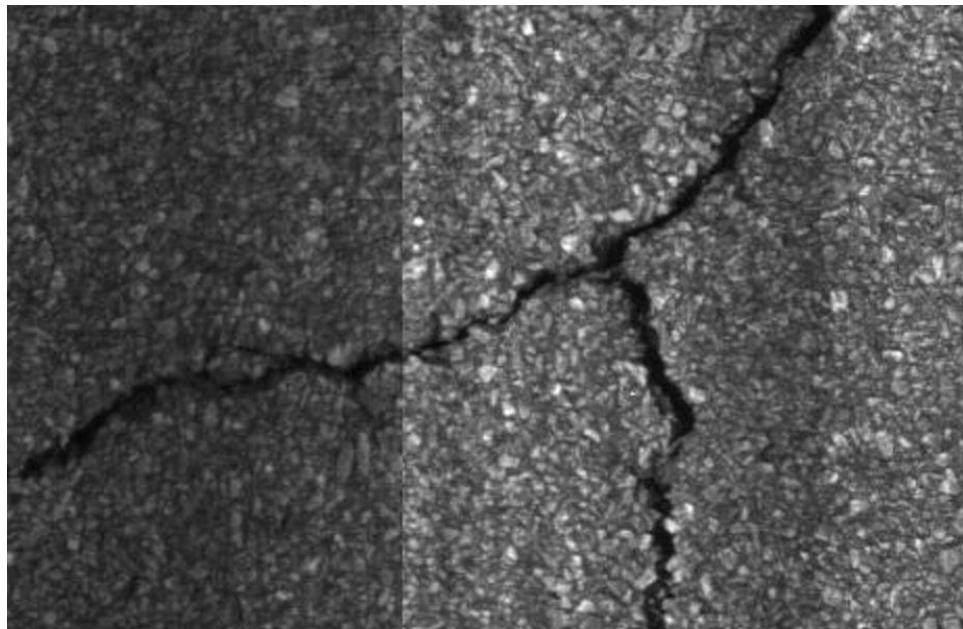

**Figure 4 – DTS MAC Vehicle**

Downward-facing pavement imagery was collected to be used in quantifying distress type, severity, and extents present on segments of road. The resolution of the imagery allowed for distresses to be easily identified and measured during the analysis portion of the contract. This will be described in section 2.2 below.

**Figure 5 – Asphalt Concrete (AC) Pavement Image Example**

**Figure 6 – Close-up Pavement Image Example**

Right-of-way (ROW) images were also collected as part of this contract. The MAC vehicle was configured with a four-camera setup: three forward-facing cameras and one rear-facing camera. The images were captured at roughly 15-foot intervals and were post-processed using collected inertial and GPS data. This allowed for more accurate asset extraction to be completed downstream if the need ever arose.

**Figure 7 – Right-of-Way Image Example**

The automated data collection efforts for the City of Rockwall Road Network began towards the end of June 2016 and was completed in the beginning of July 2016.

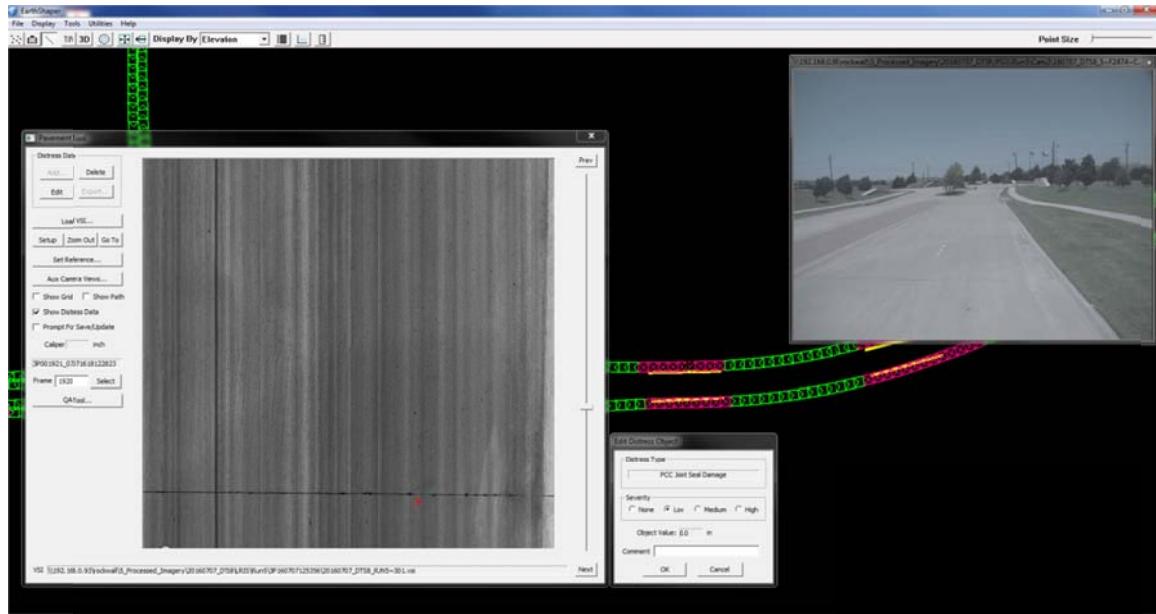

## 3 Pavement Condition Assessment

### 3.1 Pavement Distress Inventory

A pavement distress inventory consists of identifying specific pavement surface distress types that are associated with the degradation of a pavement surface. The most common causes of pavement degradation are traffic loads, environmental factors, lack of maintenance, and other man-made or natural occurrences.

The distress type is then assigned one of three severity ratings: low, moderate, or high. The extents and severity of the distress type are then recorded. For this project; the pavement distress types, severity definitions, and measurements were inventoried utilizing the ASTM D6433 method of pavement condition assessment for both Asphalt Concrete (AC) and Portland Cement Concrete (PCC) pavements. The inspections covered 100% of the length of a Sample segment for the outside lane of travel. For roads with three or more lanes, the inspection covered the outside and the inside lane. Those roads were inspected utilizing the ASTM D6433 sampling approach (completed for both directions of travel). Due to their limiting width, the secondary alleys were only collected and surveyed in one direction-of-travel.

DTS utilized our spatial image analysis software EarthShaper™ to analyze and digitize pavement distress types, extents, and severities as a point, line, or polygon. Depending on the distress type measurement required by the project data dictionary, each pavement image's distress data was digitized and recorded to a database and associated to the street section being surveyed. Each distress type, severity, and extent is recorded to the project pavement condition database; and each street section's total type, severity, and extent is calculated.

**Figure 8 – EarthShaper Pavement Tool Example**

This method of pavement distress inventory provides a quantifiable and repeatable process for the City. Each street segment, in conjunction with the pavement and right-of-way imagery, allows pavement engineers to review each pavement technician's data. This allows for an open quality control (QC) process that is defendable and repeatable. The distress data was then imported into the VUEWorks Asset Management Software, where the PCI was calculated. The distribution of the Roads Network by pavement type can be observed below.

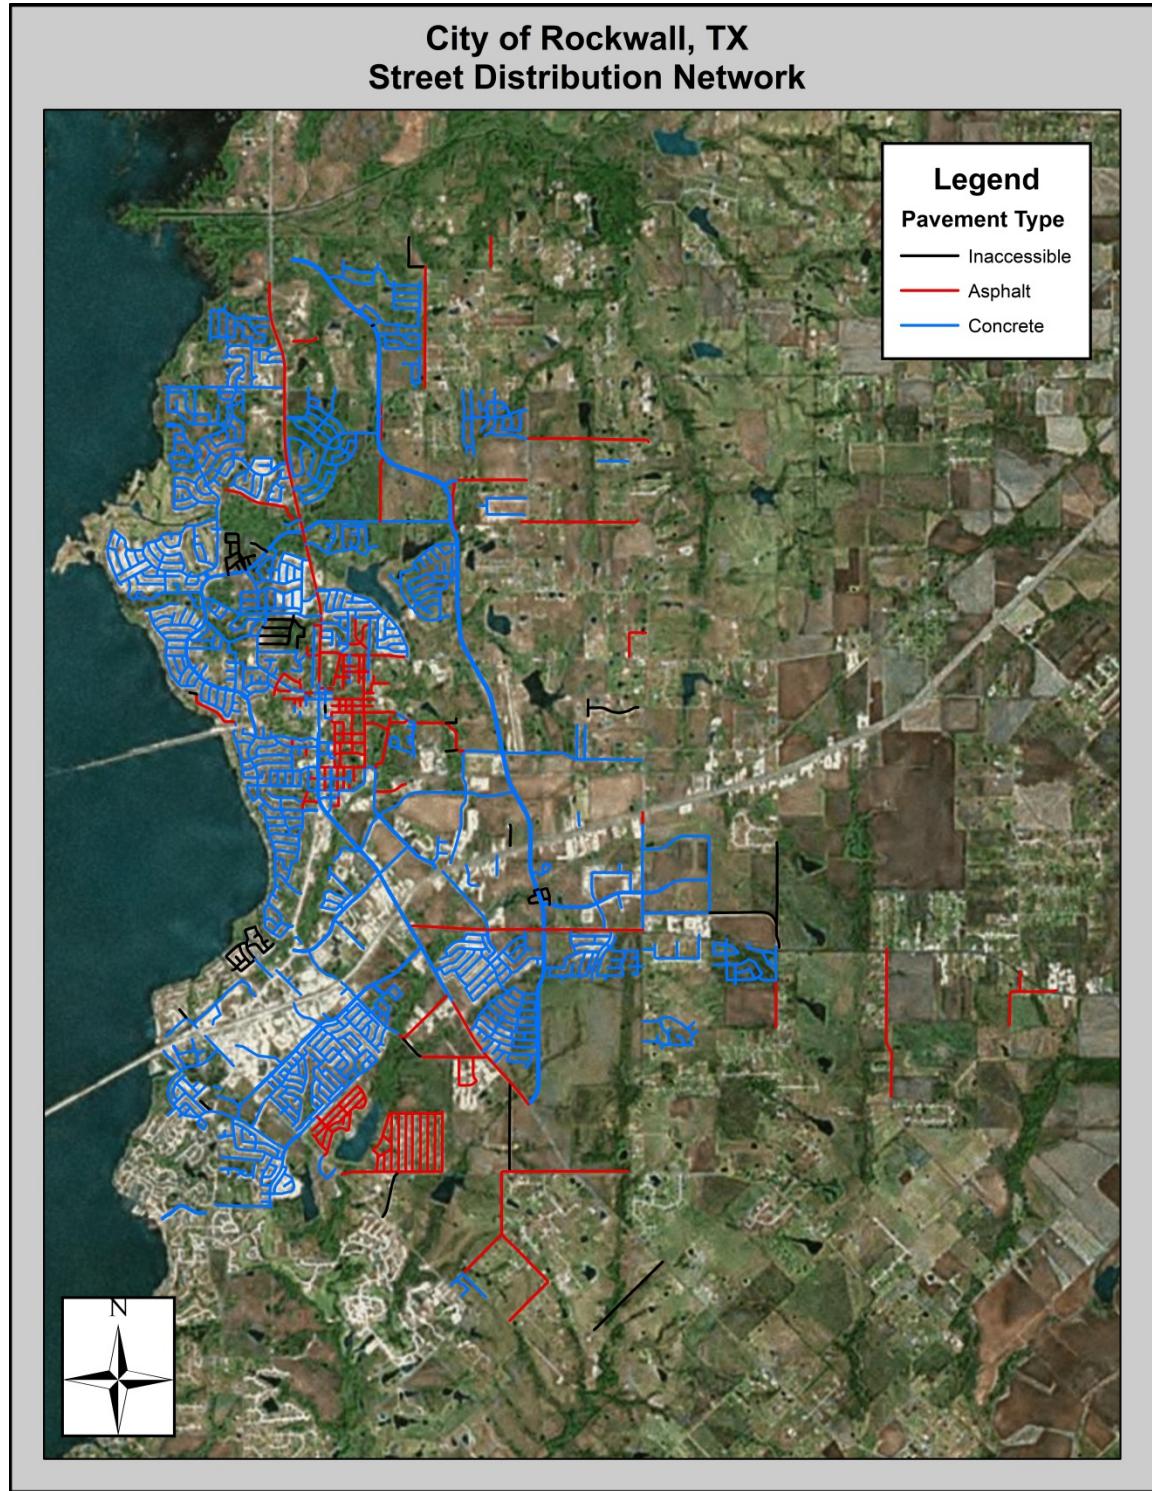

Figure 9 – Network Distribution of Pavement Type, Primary Streets

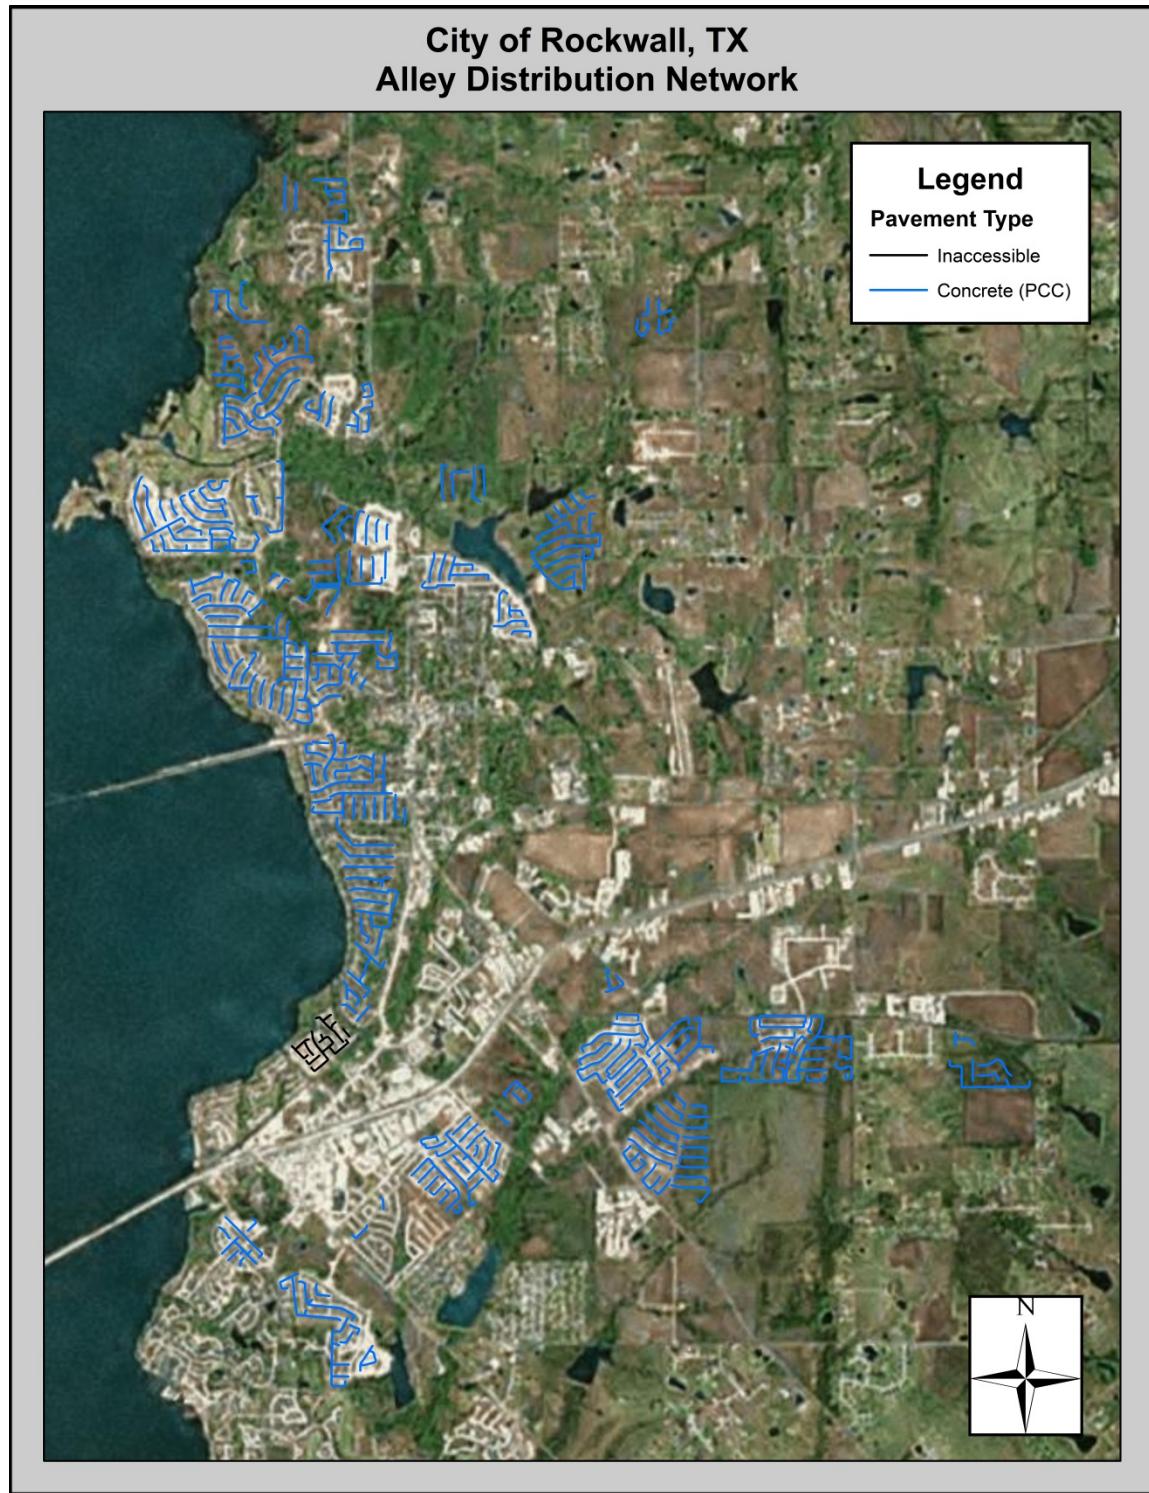

Figure 10 – Network Distribution of Pavement Type, Secondary Alleys

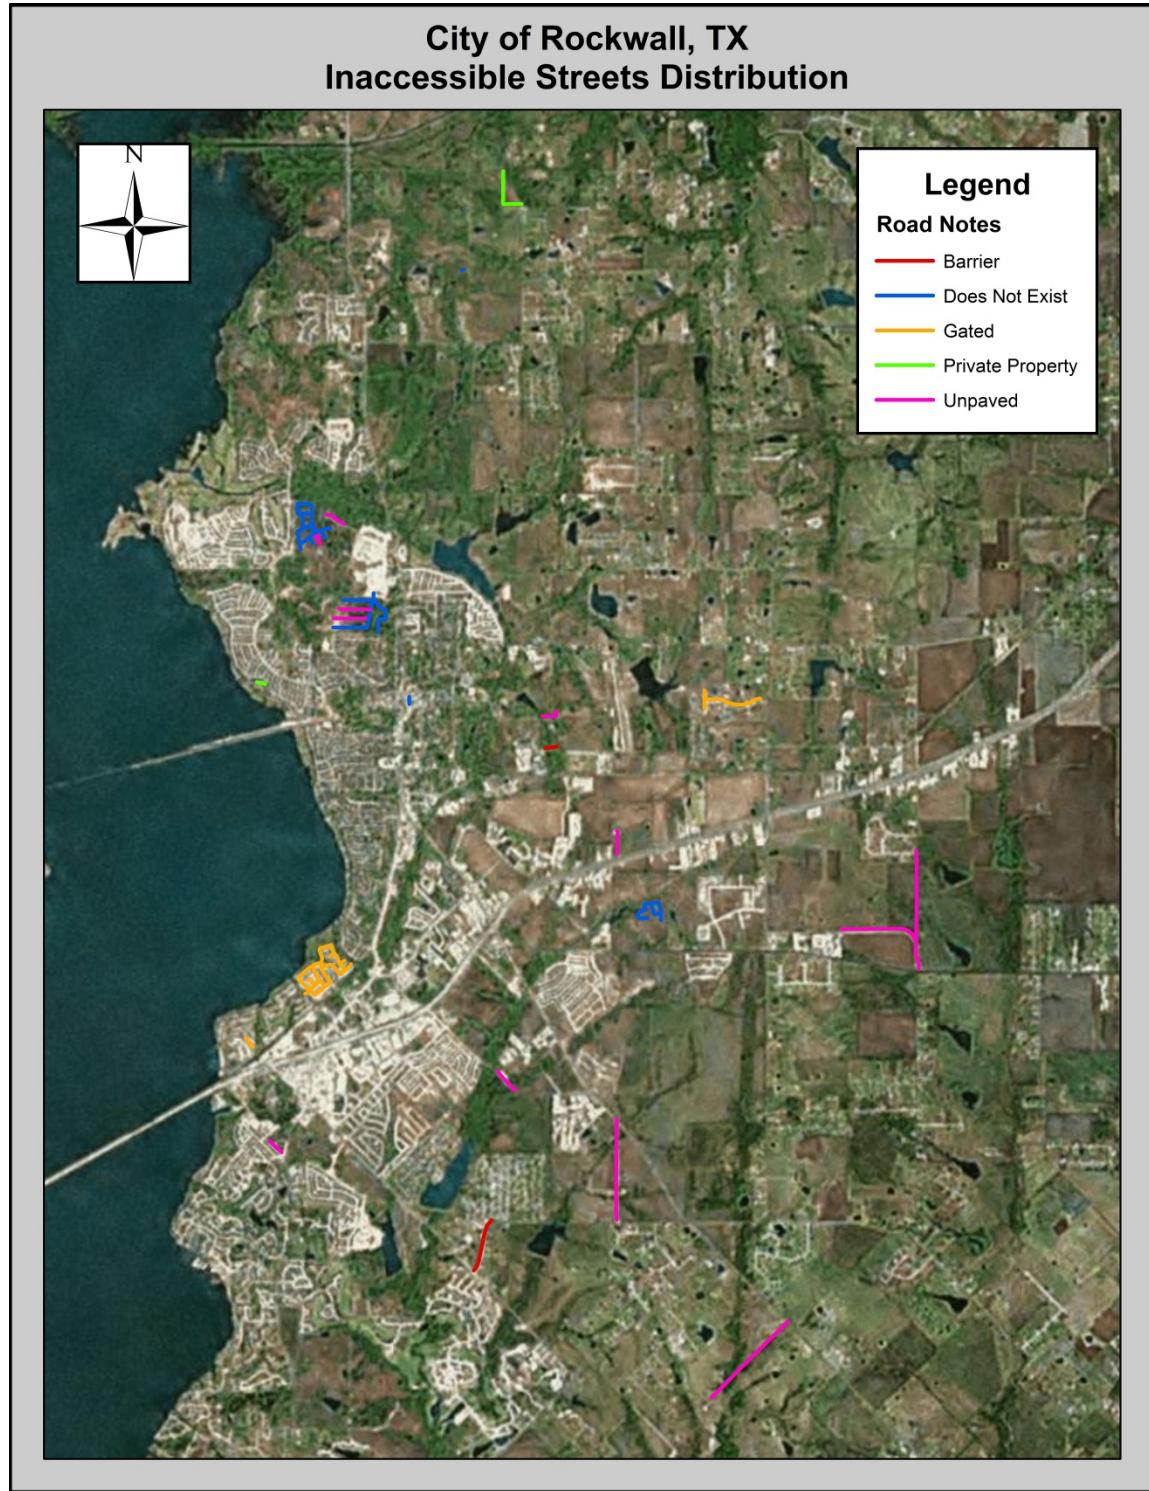

Figure 11 – Network Distribution of Inaccessible Roads, Primary Streets

Figure 12 – Network Distribution of Inaccessible Roads, Secondary Alleys

### 3.2 Pavement Condition Index (PCI) Calculation

Each street and alley segment's pavement condition index (PCI) was calculated utilizing DTS' VUEWorks Asset Management Software (AMS). This asset management software is based on the ASTM D6433 method of calculating a street segment's pavement condition index value using the pavement inventory database and ASTM D6433 deduct curves.

With a completed pavement condition inventory database, DTS imported the street and alley segment, inspection, sample, and distress information into AMS; where the PCI was calculated. ASTM D6433 is based on a 0 to 100 rating scale where 0 represents a failed roadway condition and 100 represent an excellent roadway condition.

Pavement Condition Index (PCI)		CONDITION DESCRIPTION
100 86		GOOD
85 71		SATISFACTORY
70 56		FAIR
55 41		POOR
40 26		VERY POOR
25 11		SERIOUS
10 0		FAILED

Figure 13 – ASTM D6433 PCI Description Groups

Review of the City's PCI values shows a general breakdown of street segments by condition to be:

Pavement Condition Index (PCI) Range	Condition Description	Percent of Network	Legend
86-100	Good	46.96%	Green
71-85	Satisfactory	31.19%	Light Green
56-70	Fair	11.88%	Yellow
41-55	Poor	5.02%	Orange
26-40	Very Poor	3.81%	Red
11-25	Serious	1.09%	Dark Red
0-10	Failed	0.05%	Grey
<b>Total</b>		100%	

**Figure 14 – City of Rockwall Primary Street PCI Ranges by Percent**

Review of the City's PCI values shows a general breakdown of alley segments by condition to be:

Pavement Condition Index (PCI) Range	Condition Description	Percent of Network	Legend
86-100	Good	33.71%	Green
71-85	Satisfactory	29.14%	Light Green
56-70	Fair	13.13%	Yellow
41-55	Poor	8.81%	Orange
26-40	Very Poor	7.92%	Red
11-25	Serious	6.62%	Dark Red
0-10	Failed	0.67%	Grey
<b>Total</b>		100%	

**Figure 15 – City of Rockwall Secondary Alley PCI Ranges by Percent**

Figure 16 –City of Rockwall Street Network PCI Map

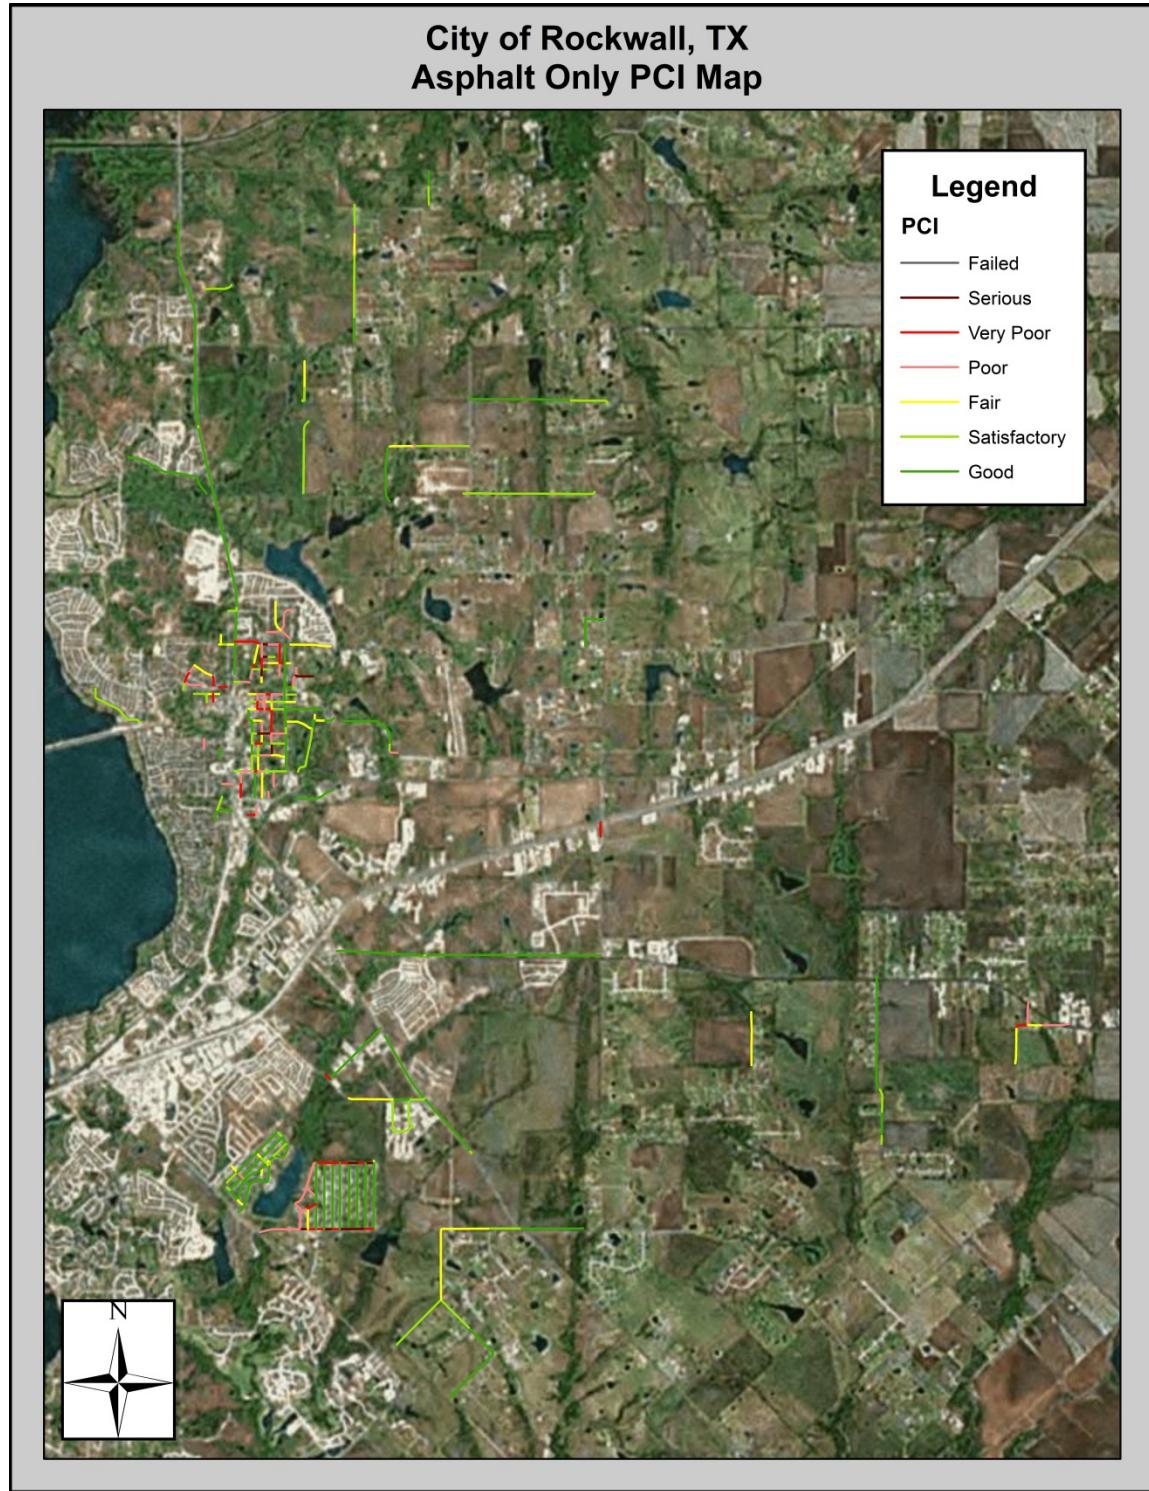

Figure 17 –City of Rockwall Asphalt Streets Network PCI Map

Figure 18 –City of Rockwall Concrete Streets Network PCI Map

Figure 19 – City of Rockwall Asphalt Streets Example PCI Map

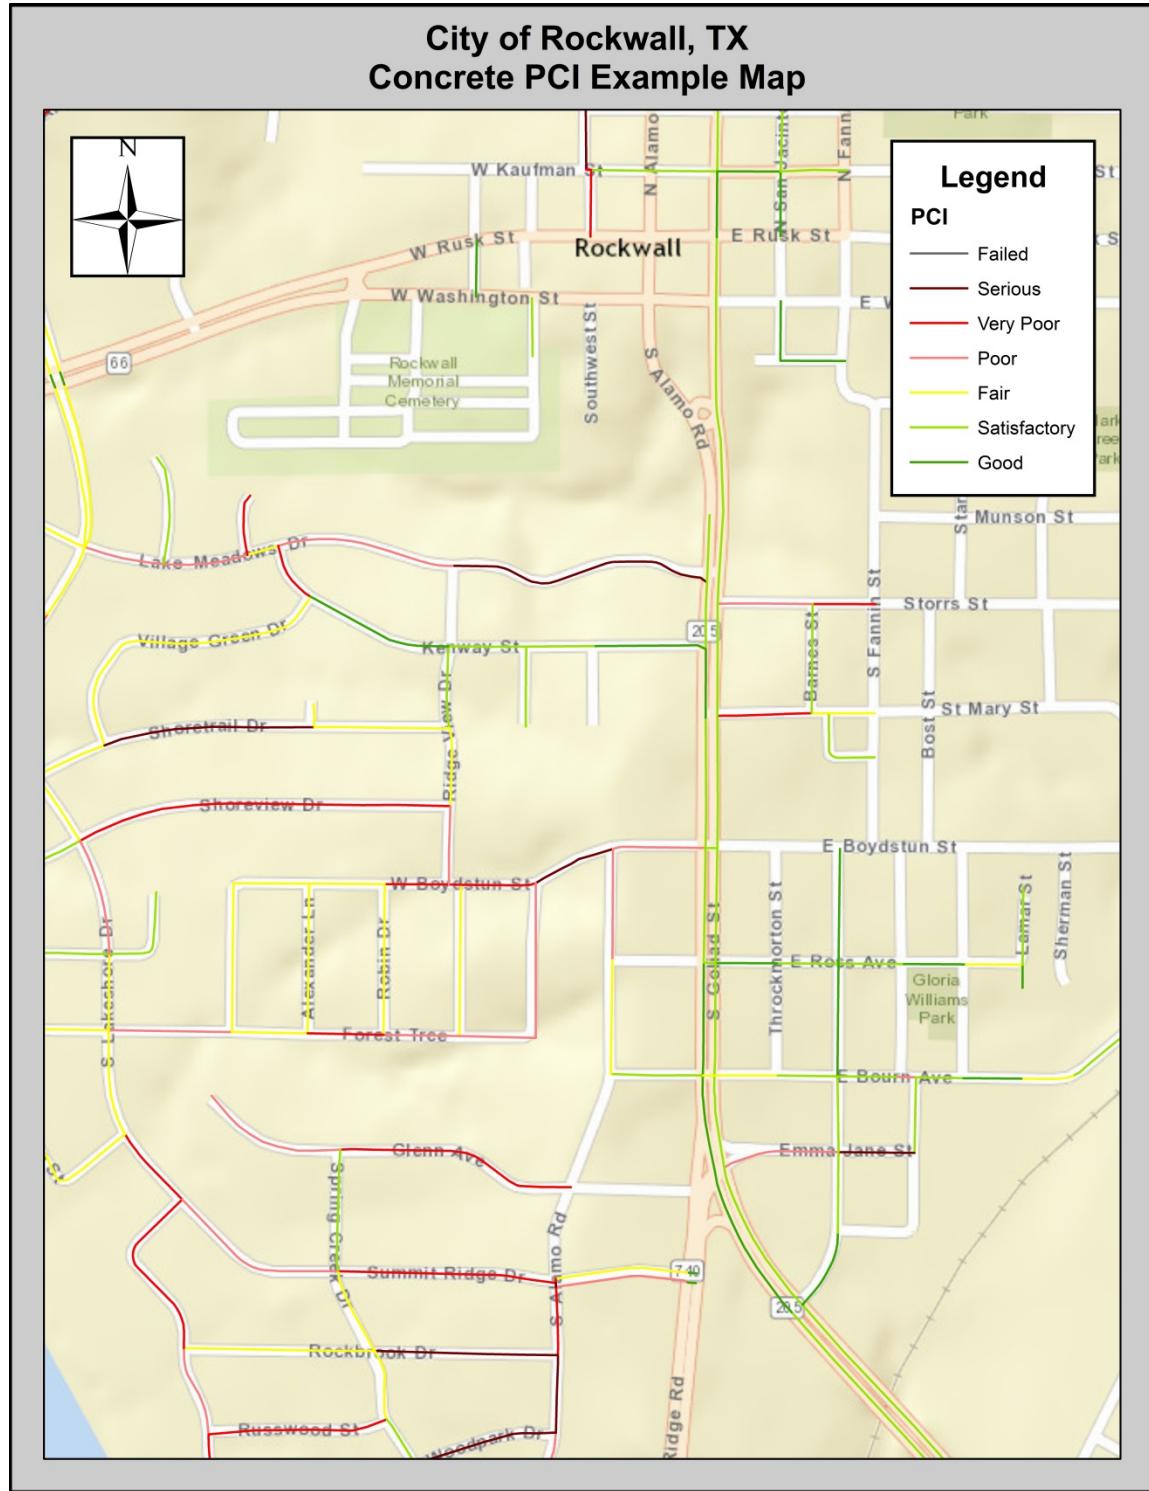

Figure 20 – City of Rockwall Concrete Streets Example PCI Map

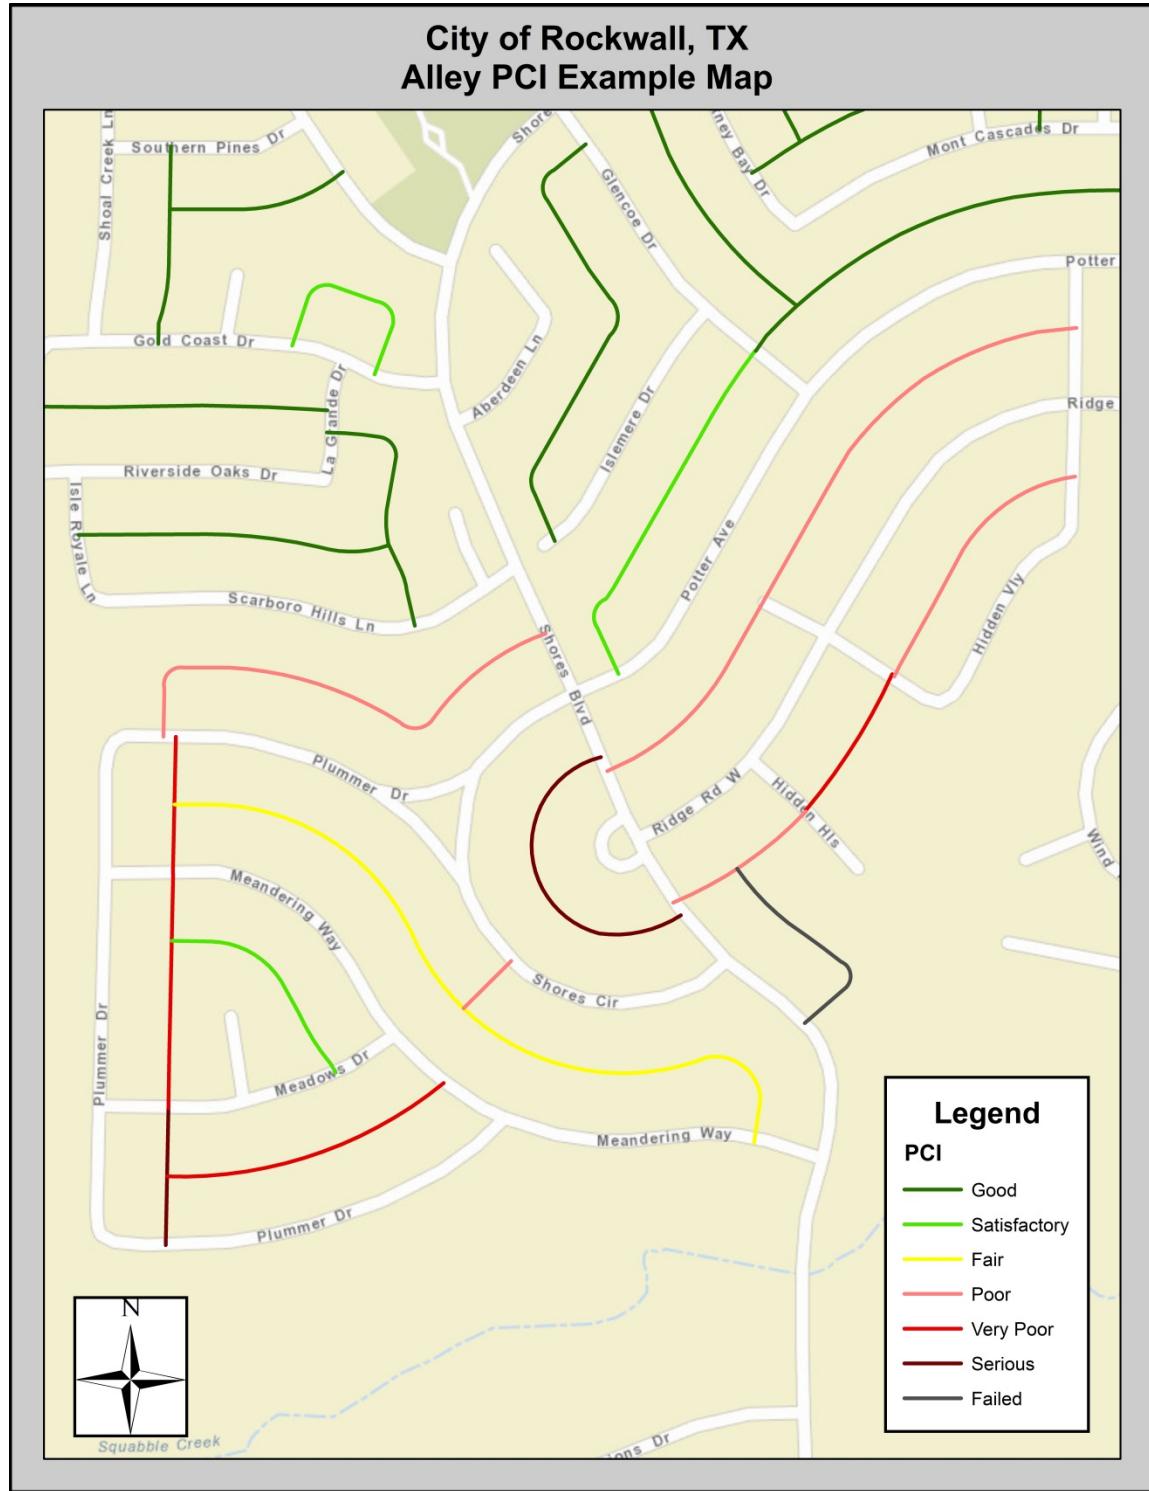

Figure 21 – City of Rockwall Alleys Example PCI Map

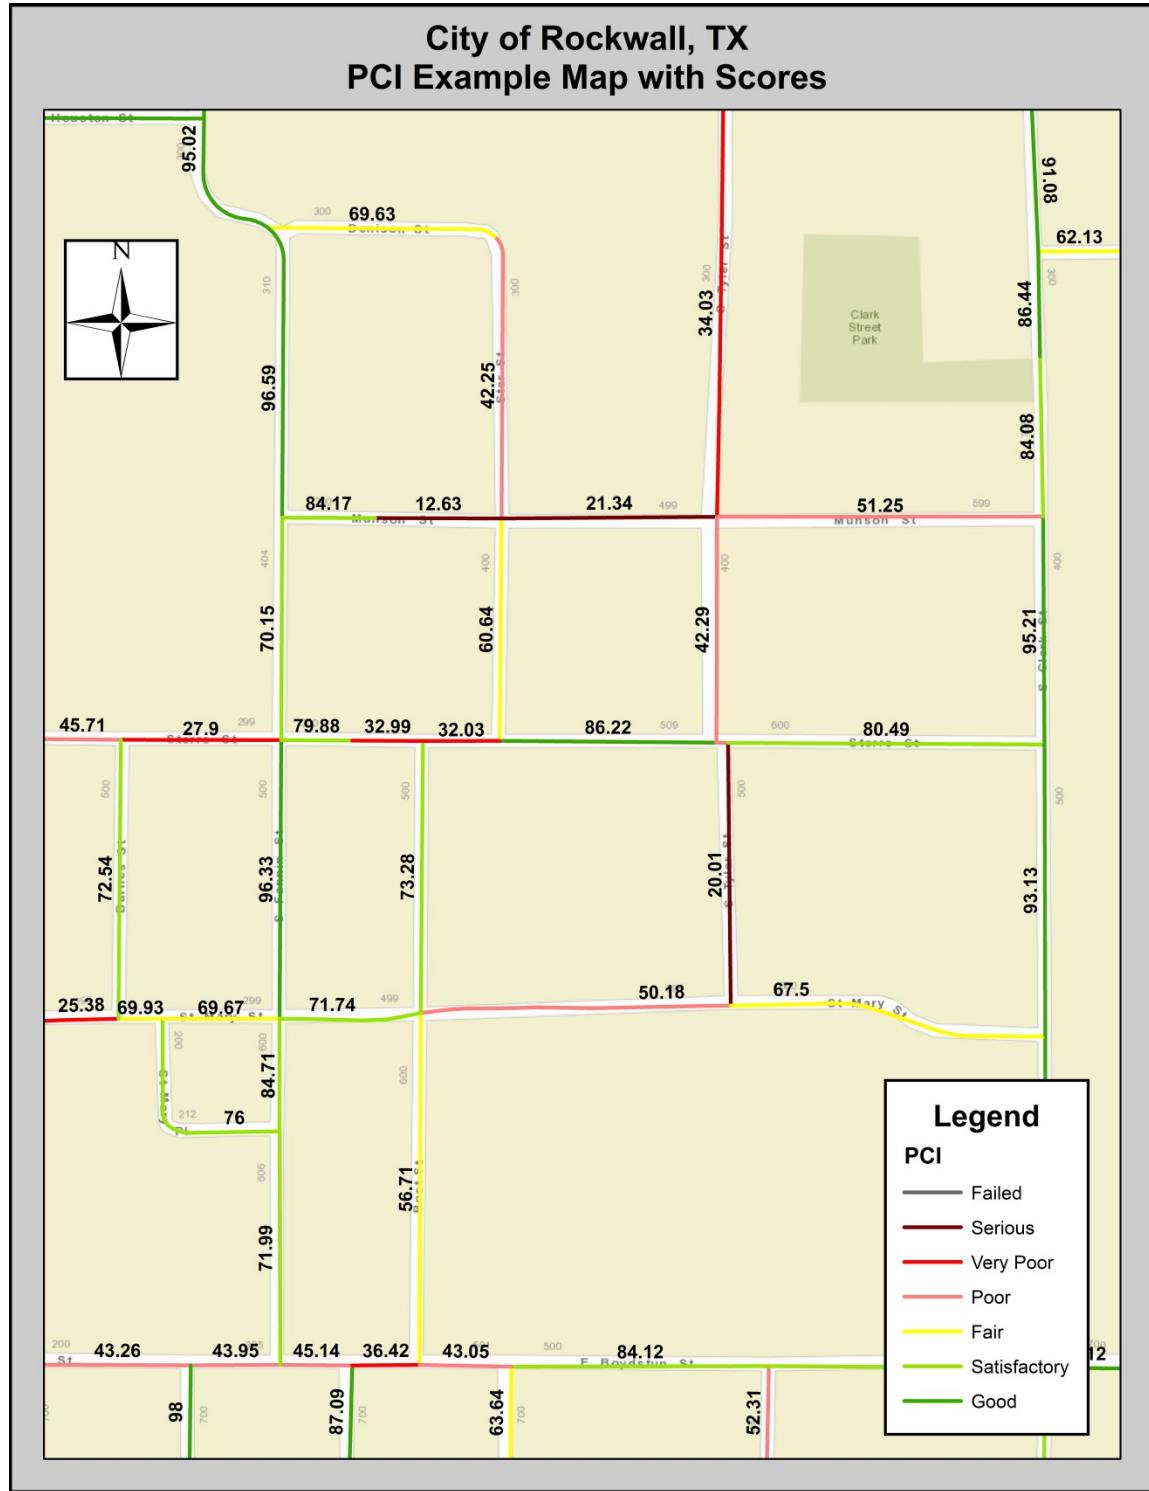

Figure 22 – City of Rockwall Streets Example PCI Map with Scores

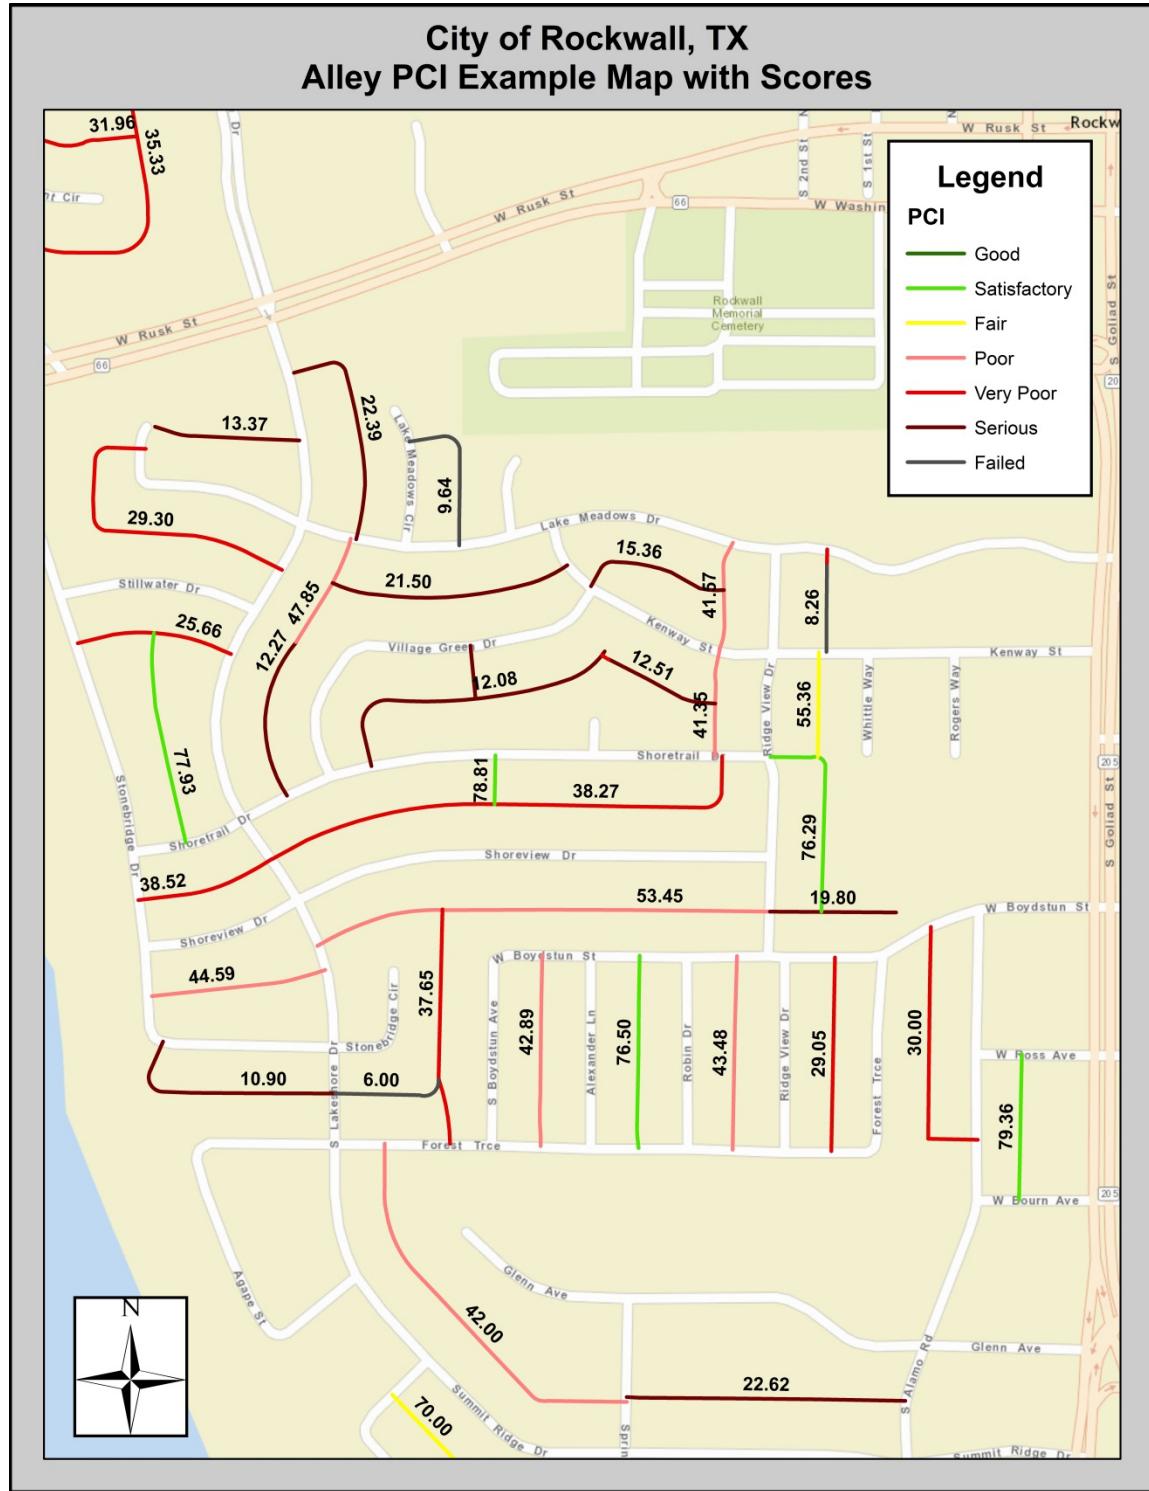

Figure 23 – City of Rockwall Alleys Example PCI Map with Scores

The average PCI value of each road segment network was calculated and presented in the table below. These scores are dependent on the road conditions at the time of collection. The values indicate the Roads Network for Streets and Alleys falls within the 'Satisfactory' and 'Fair' condition ranges, respectively.

Road Network Type	Average PCI	Condition Range
Asphalt Streets	68.06	Fair
Concrete Streets	80.06	Satisfactory
Overall Streets	78.34	Satisfactory
Concrete Alleys	69.21	Fair

**Figure 24 – City of Rockwall Average Network PCI Comparison**

### 3.3 Pavement Condition Results

The Road Network consists of approximately 284 centerline miles of roadway. The majority of these roads are asphalt. The distribution of the current roadway network by surface type is presented below and outlines the number of miles that were able to be collected and analyzed, as well as the number of miles that were not able to be collected (with reason why).

#### Breakdown of Road Inspection Miles

Item	Description	Miles	% of CL Miles
1	Street Asphalt Segment with PCI	37.62	13.26%
2	Street Concrete Segment with PCI	174.95	61.68%
3	Alley Asphalt Segment with PCI	0.00	0.00%
4	Alley Concrete Segment with PCI	59.74	21.06%
5	Not Collected – Barrier	0.44	0.16%
6	Not Collected - Does Not Exist	2.73	0.96%
7	Not Collected – Gated	3.92	1.38%
8	Not Collected – Private Property	0.20	0.07%
9	Not Collected – Unpaved	4.05	1.43%
<b>TOTAL WITH PCI</b>		272.31	96.00%
<b>TOTAL WITHOUT PCI</b>		11.34	4.00%
<b>TOTAL</b>		283.65	100%

**Figure 25 – City of Rockwall Inspection Breakdown**

Further review of the City's PCI values shows an in-depth breakdown of street segments by pavement type and condition to be:

Pavement Condition Index (PCI) Range	Condition Description	Percent of Network	Legend
86-100	Good	49.42%	Green
71-85	Satisfactory	19.88%	Light Green
56-70	Fair	18.46%	Yellow
41-55	Poor	4.39%	Orange
26-40	Very Poor	5.34%	Red
11-25	Serious	2.20%	Dark Brown
0-10	Failed	0.31%	Grey
<b>Total</b>		100%	

Figure 26 – City of Rockwall Asphalt Streets PCI Ranges by Percent

Pavement Condition Index (PCI) Range	Condition Description	Percent of Network	Legend
86-100	Good	46.43%	Green
71-85	Satisfactory	33.62%	Light Green
56-70	Fair	10.47%	Yellow
41-55	Poor	5.16%	Orange
26-40	Very Poor	3.48%	Red
11-25	Serious	0.84%	Dark Brown
0-10	Failed	0.00%	Grey
<b>Total</b>		100%	

Figure 27 – City of Rockwall Concrete Streets PCI Ranges by Percent

The breakdown of the types of distresses for both concrete and asphalt (for primary streets) and only concrete (for secondary alleys) can be seen below.
